Pacific Northwest Sepsis Conference 2019

Call for Abstracts

Authors are invited to submit original research, quality improvement data, educational initiatives, and case reports related to pathophysiology, screening, diagnosis, treatment, emerging therapies, or basic science of sepsis or severe infection. At the time of submission, abstracts must not have been accepted for publication in any journal, but may have been presented at other meetings.

Author Instructions:

Abstracts should be no greater than 300 words, including the following sections: Title, Background, Methods, Results, Conclusion.

Please submit contact information (e-mail and phone number) for the corresponding author, as well as full names, degrees, and affiliations for all authors.

Accepted abstracts will either be presented in an oral session on 6/18/2019 OR in a poster session the same day. Oral presentations are 8 minute (5 minute presentation, 3 minutes for questions and discussion) podium presentations. The required format is a maximum of 6 (six) PowerPoint or Keynote slides (organized into the following sections: Background, Methods, Results, Conclusion). Poster specifications will be provided upon acceptance of abstract.

If you prefer your submission to be considered for poster only, please note this when you submit.

Submission Deadline is March 15, 2019

You will be notified if your submission has been accepted for oral or poster presentation by April 10, 2019

Additional Abstract Tips:
A structured abstract is required and should be organized into the four sections below.

Background: Outlines the question addressed. Make the first sentence of the introduction as interesting as possible. If space permits, provide a concise review of what is known about the problem addressed by the research, what remains unknown, and how your research project fills the knowledge gaps. The final sentence of the introduction describes the purpose of the study or the study's a priori hypothesis.

Methods: For most clinical research abstracts, the following areas are specifically mentioned: research design; research setting; number of patients enrolled in the study and how they were selected; a description of the intervention (if appropriate); and a listing of the outcome variables and how they were measured. Finally, the statistical methods used to analyze the data are described.

Results: Begins with a description of the subjects that were included and excluded from the study. For those excluded, provide the reason for their exclusion. Next, list the frequencies of the most important outcome variables. If possible, present comparisons of the outcome variables between various subgroups within the study. Numerical results should include standard deviations or 95% confidence limits and the level of statistical significance. If the results are not statistically significant, present the power of your study to detect a difference.

Conclusion: State concisely what can be concluded and its implications. The conclusions must be supported by the data presented in the abstract; never present unsubstantiated personal opinion. If there is room, address the generalizability of the results to populations other than that studied and the weaknesses of the study.

Within the body of the abstract:
• DO NOT include illustrations, images or graphs.
• DO NOT insert code for justification, hyphenation, line height, line centering, margins, spacing, fonts, page centering, page numbering, suppression, or tabs, underlining, boldface type, italics, subscripts, superscripts, or to insert headings, spaces between paragraphs, references, or footnotes
• DO NOT use bulleted lists
• DO NOT use abbreviations on first mention; spell out the name in full and follow with the abbreviation in parenthesis. Abbreviations may be used in subsequent mentions

Please note: Your abstract will not be edited; you are responsible for any spelling, grammatical, and typographical errors

Please submit abstracts to sepsisab@uw.edu
